What is the project?

The project is aiming to use computational methods to answer biologically significant questions on wheat grain morphology and domestication using μ CT images.

To do this, I will be using:

- Computer vision on 3D image sets
- Statistical analysis and data science
- Scientific theory to create reproducible results

Research Question:

Is it possible to use μ CT imaging to answer questions about Wheat domestication?

I hope so!

Null-Hypothesis

- H_0 = Domestication has no effect on the morphometric properties of wheat
- H_0 = Ploidy has no effect on the morphometric properties of wheat
- H_0 = There is no difference in hulled and non-hulled genotypes

**Hulling is a trait associated with domestication*

Materials (Plant)

I have a wide range of Wheat genotypes, these are:

- Ranged between diploid, tetraploid and hexiploid
- 12 total genotypes
- Divided between domestication status

Figure 1: A Primitive Wheat Spike

Methods (Image Generation)

Capture Methods

In order to generate this data a μ CT100 scanner (ScancoMedical, Switzerland) was used Each spike was:

- ~1000 slices (51 slices per stack),
- 125 projections/ 180° were taken and a
- binning of 6 was used.
- Output images are a 0.2 megapixel (512×512) resolution ($68.8 \mu/\text{pixel}$)

Data Gathering

MATLAB Software

Data has been extracted from the μ CT images using a method I previously developed at IBERS [1]. A lot of additions and novel augmentations have been added in order to work with the range of Wheat genotypes.

- This is done via separating non-grain from grain ROIs in the image data
- Measurements are taken on a per grain level
- Measurements are in mm, mm² and mm³ based on type
- Data is exported as CSV files

Improved Watershedding Algorithm

Algorithm

$$|x_1 - x_2| + (\sqrt{2} - 1), |x_1 - x_2| > |y_1 - y_2| (\sqrt{2} - 1) |x_1 - x_2|, \text{ otherwise} \\ (1)$$

Visual Example

Figure 2: *A* showing the chessboard method, *B* improved quasi-euclidean method

Data Analysis *WIP*

Statistical Methods to be implemented

These will be implemented in Python using the library *SciPy* [2]

- ANOVA
- MANOVA
- GLMs
- χ^2 Tests
- PCA
- T/F-Tests

Graphing Methods to be implemented

All Graphing is being implemented using Matplotlib [3]

- Box
- Swarm
- Scatter / LM
- Violin
- Correlation Maps
- Frequency/Histograms

Reproducible Analysis GUI *WIP*

Additional Aims

Not yet started, but would like to implement by end of project

- Automate error finding and identification
- Visually Display Errors in Data
- Write testing suite for software

Ideas for future work

- Test software library on other datasets
- Grow more plants and create more replicates for more robust study
